Reset admin password for Dolphin

Find and open phpmyadmin and select your database. Find the **Table "admins**" and select the **action** "**Browse**". There you will find your **admin login and password**. The password is **md5 encrypted**, so **you cannot just change it** to "password". You will need to use an online tool Md5 Creator Online - Crytoplogy to convert a password to md5 format.

For example, the work password in md5 format looks like: 5f4dcc3b5aa765d61d8327deb882cf99

It is a good idea to **download and backup your database** before attempting this operation.
